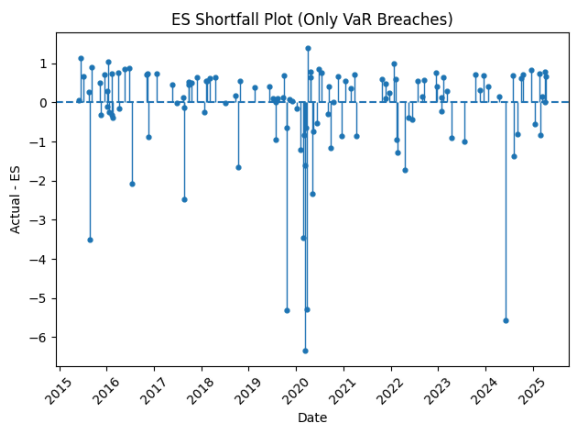
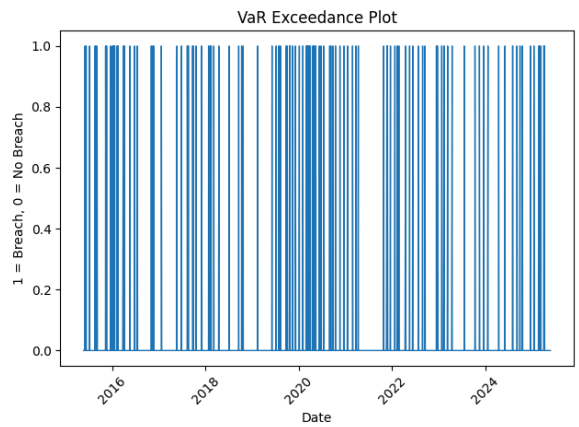
Results link : updated results
Log returns link : log_4returns
log_returns
Code link : for h1 and with kde, updated threshold,pit.ipynb
for h10 and with kde, updated threshold,pit.ipynb
for h10 and without kde, updated threshold,pit.ipynb
for h1 and without kde, updated threshold,pit.ipynb

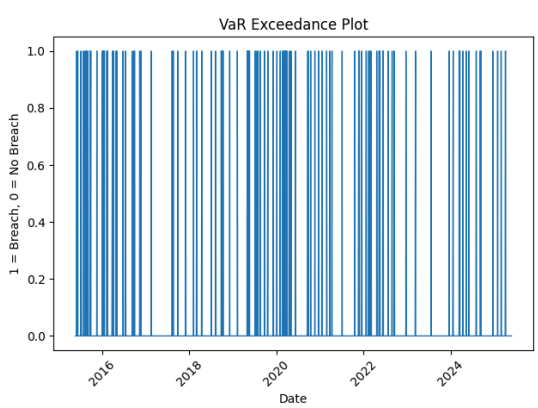
If we observe the results, Both models gave almost same mean FZ0 value and median FZ0 value and if we consider that gap , then no kde model has lesser mean FZ0 score in all cases and if we consider Median FZ0 score ,then except one case (horizon 1 , step size 10 , assets 4) in all other cases no kde model has lesser median FZ0 score . the values about fallback for each case is mentioned in results excel sheet.

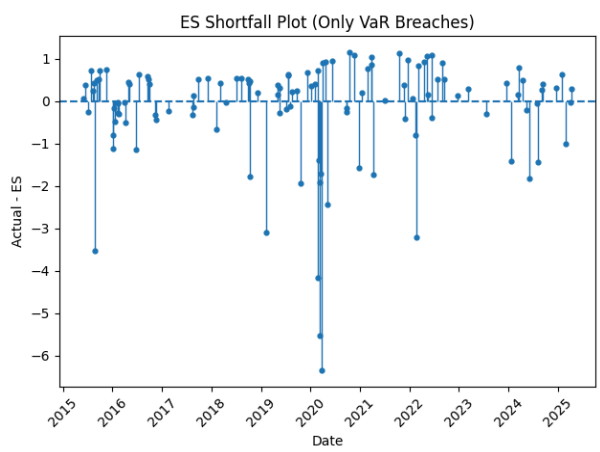
Plots after updating threshold and pit function
h=1 s=1 assets = 2 with kde



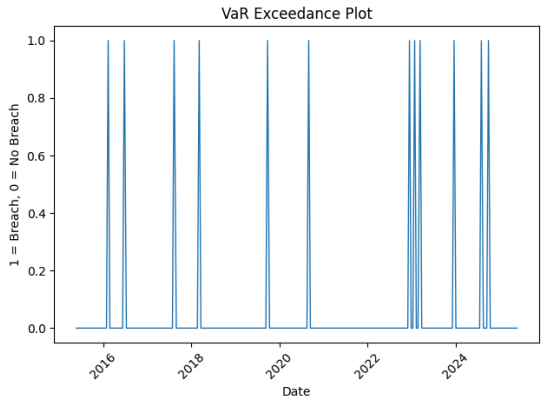


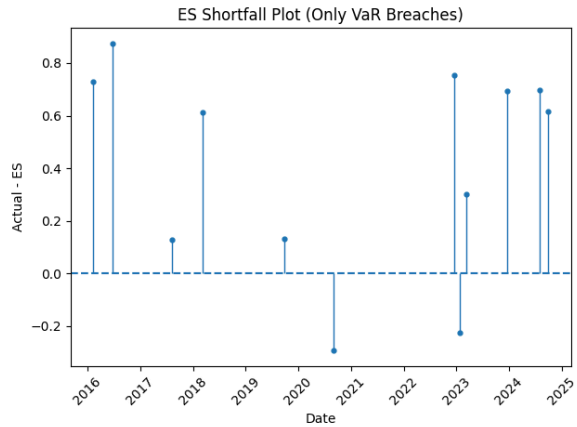
h=1 s=1 assets = 4



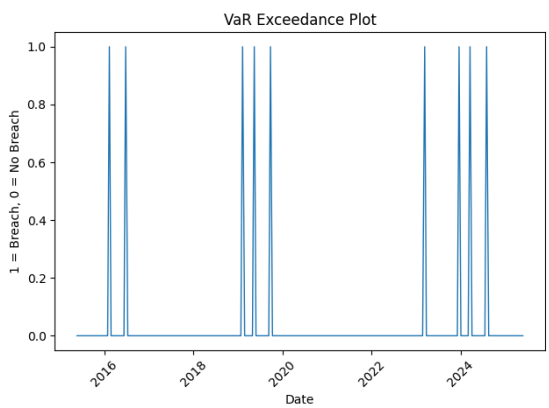


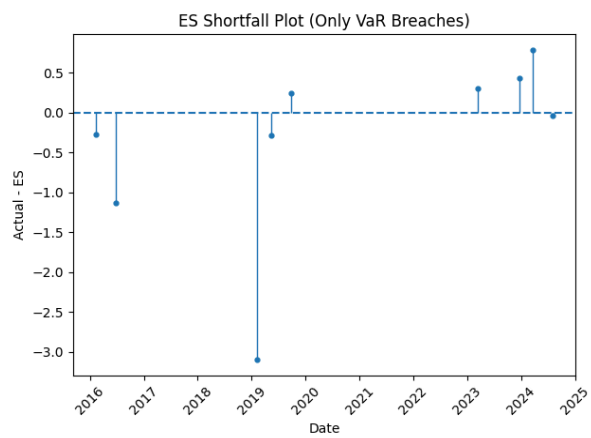
h=1 s=10 assets = 2



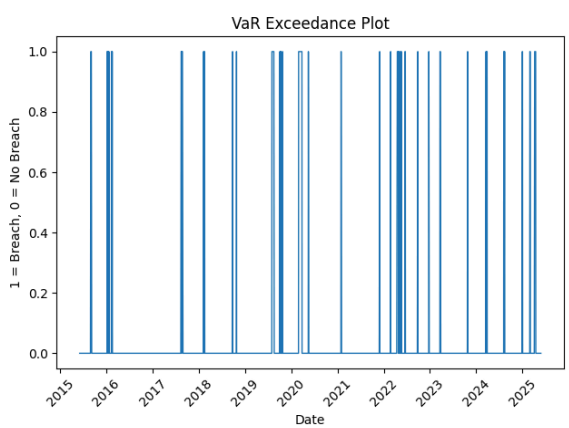


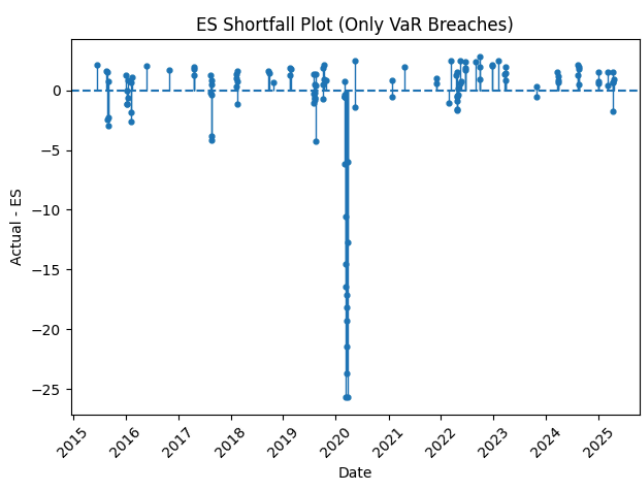
h=1 s=10 assets = 4



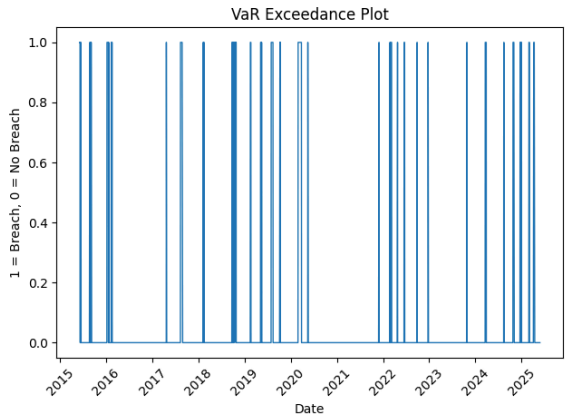


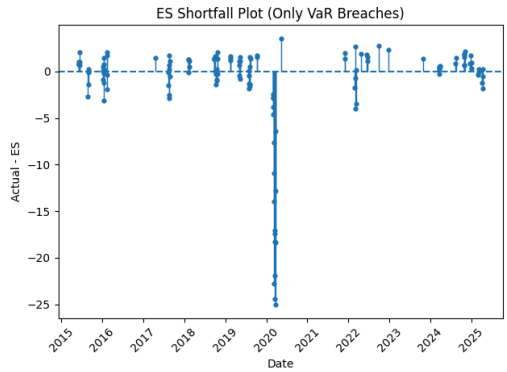
h=10 s=1 assets = 2



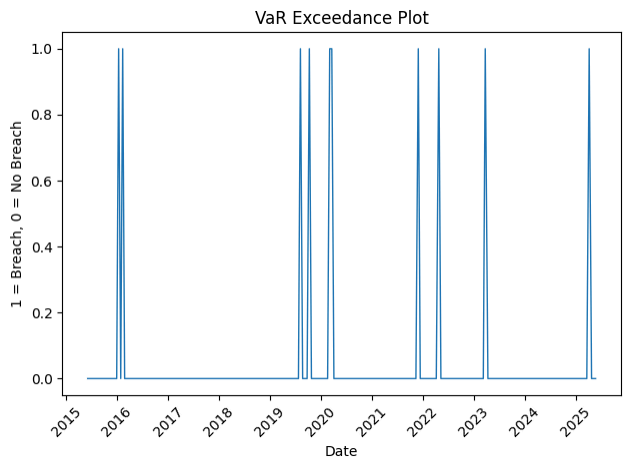


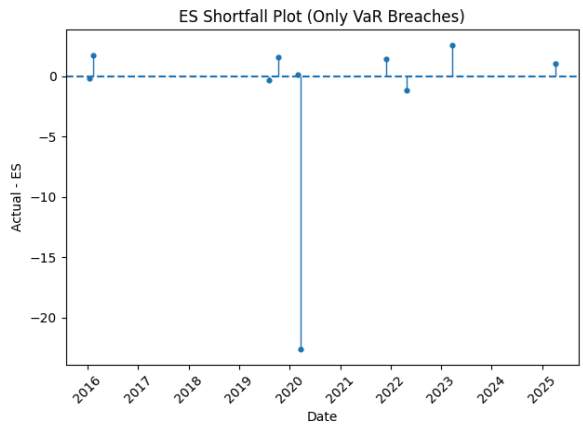
h=10 s=1 assets = 4

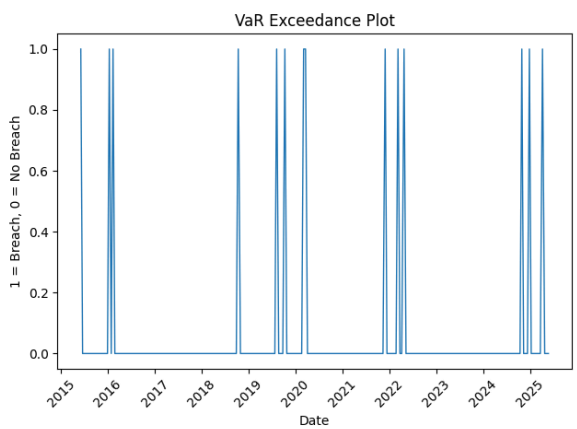


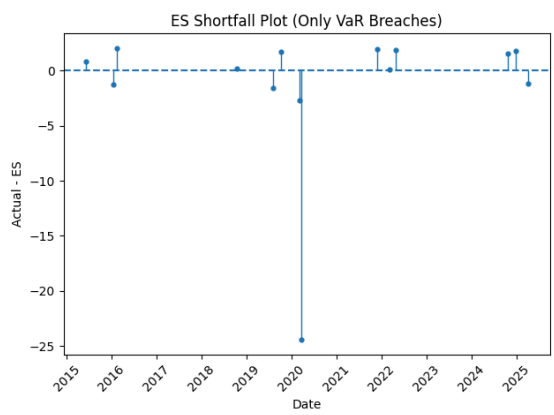


h=10 s=10 assets = 2









h=10 s=10 assets = 4
